Genetic variability of hepatitis C virus in Western Siberia.";
Submitted (APR-2002) to the EMBL/GenBank/DDBJ databases.
-1- SUBGNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY
LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCORROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF
PROTEIN C AND MRNA (BY SIMILARITY).

Submitted (APR-2002) to the EMBL/GenBank/DDBJ databases.
-1- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A
LIPOPMOTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN AND GLYCOPROFIEN E. THE NUCLEOCAPSID IS A COMPLEX OF
PROTEIN C AND MANA (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                     Viruses; ssRNA positive-strand viruses, no DNA stage; Flaviviridae;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Description

TITLE OF INVENTION: New sequences of hepatitis C virus
TITLE OF INVENTION: genotypes for diagnosis, prophylaxis and therapy.
WUMBER OF SEQUENCES: 270
COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.25 (EPO)
CURRENT APPLICATION DATA:
                                                                                                                                                                                                                                                                               New sequences of hepatitis C virus genotypes for diagnosis, prophylaxis and therapy. 270
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

Sequence 44, Application US/09899046

"UBICATION NO. US20030008274A1
GENERAL INFORMATION:
TITLE OF INVENTION: New sequences of hepatitis C virus
TITLE OF INVENTION: Qenotypes for diagnosis, prophylaxis and therapy.
NUMBER OF SEQUENCES: 270
COMPUTER FRADABLE FORM:
MEDIUM TYPE: IBM PC compatible
COMPUTER: IBM PC compatible
COMPUTER: IBM PC compatible
COMPUTER: PatentIn Release #1.0, Version #1.25 (EPO)

                                                                                                                                                                                                                                                                  ö
                                                                                      provided. The method is designated restriction endonuclease assisted are useful (REAL). The mosaic protein and the artificial mosaic protein are useful for detecting a hepatitis infection in an individual. The mosaic gene and protein is also useful for vaccination against infection, especially hepatitis C. The method of synthesizing the artificial gene and the resulting mosaic protein improve the sensitivity, spectrum of immunoreactivity, and antigen specificity of enzyme immunoassays. This provides improved detection of hepatitis C virus. Sequences AAY06673-681 represent amino acid sequence of each monomer comprising the NC mosaic protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a mosaic protein, comprising a plurality of homologous antigenic peptides from different genotypes of a species. The antigenic peptides are from nucleocapsid (NC) proteins. A method for synthesising an artificial gene that encodes the mosaic protein is also provided. The method is designated restriction endonuclease assisted ligation (REAL). The mosaic protein and the artificial mosaic protein are useful for detecting a hepatitis infection in an individual. The mosaic gene and protein is also useful for vaccination against infection, especially hepatitis C. The method of synthesizing the
                                    The invention relates to a mosalc protein, comprising a plurality of homologous antigenic peptides from different genotypes of a species. The antigenic peptides are from nucleocapsid (NC) proteins. A method for synthesising an artificial gene that encodes the mosalc protein is also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Mosaic protein; antigenic peptide; nucleocapsid; NC; hepatitis; REAL; restriction endonuclease assisted ligation; vaccination.
                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New mosaic protein, comprising a plurality of homologous antigenic peptides from different genotypes of a species - useful for detecting hepatitis infection in an individual

comparising a flavivinus mutant that has a deletion of at least 4 comparising a flavivinus mutant that has a deletion of at least 4 comparising a flavivinus mutant that has a deletion of at least 4 correction acids from the capsid protein, provided that the c-terminal hydrophobic region is not affected by the deletion. The vaccine of the invention has virucide, antinflammatory and hepatotropic activity. The attenuated vaccine, and similar nucleic acid vaccines that encode the mutated capsid protein, are useful for protection against a vide range of flavivirus diseases, e.g. yellow fever, Japanese encephalitis, dengue, classical swine fever, bovine viral diarrhoea and hepatitis C. The specified deletion: (i) produces a reliably attenuated virus that does not revert to virulence; (ii) is exactly defined and does not effect immune responses to important proteins; and (iii) can not generate a non-natural virus by recombination. The mutant viruses eliminate the need to produce large amounts of infectious/virulent viruses, and can be produced with less expense. The protective response to flusivalvirus lasts significantly longer than that to killed vaccines. This sequence represents a fragment of the capsid protein from Heptitis c virus (HCV) type I described in the disclosure of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
artificial gene and the resulting mosaic protein improve the sensitivity, spectrum of immunoreactivity, and antigen specificity of enzyme immunoassays. This provides improved detection of hepatitis C virus. Sequences AAY0673-681 represent amino acid sequence of each monomer comprising the NC mosaic protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Attenuated flavivirus live vaccine, useful for protection against e.g. yellow fever, comprises virus with attenuating deletion of amino acids from the capsid protein -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes a novel attenuated flavivirus live vaccine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Capsid protein; attenuated vaccine; virucide; antinflammatory; hepatotropic; yellow fever; Japanese encephalitis; dengue; classical swine fever; bovine viral diarrhoea; hepatitis C.
                                                                                                                                                                                                                                                                                                                                                                                                                                                 Length 28;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAR92936-R92987 are HCV core proteins derived from 52 different HCV isolates. Isolated cDNA sequences are used for the prodn. of primers useful for detecting the presence of HCV in a sample, the primers are also useful for HCV genotyping. Proteins encoded by the cDNAs can be used in vaccines for immunishing against HCV infection. The proteins may also be used to defect antibodies against HCV in serum, sellva, lymphocytes or other monouclear cells. The antibodies may be used in the prevention of HCV infection.
                                                                                                                                                                                                                                                                                                                                                                                                               envelope 1 and core proteins - as vaccines against HCV infection

Isolated cDNA sequences are used for the prodn. Of primers useful for detecting the presence of HCV in a sample, the primers are also useful for HCV genotyping. Proteins encoded by the cDNAs can be used in vaccines for immunising against HCV infection. The proteins may also be used to detect antibodies against HCV in serum, saliva, lymphocytes or other monounclear cells. The antibodies may be used in the prevention of HCV infection.

                                                                                                                            AAR92936-R92987 are HCV core proteins derived from 52 different HCV isolates. Isolated cDNA sequences are used for the prodn. of primers useful for detecting the presence of HCV in a sample, the primers are also useful for HCV genotyping. Proteins encoded by the cDNAs can be used in vaccines for immunising against HCV infection. The proteins may also be used to detect antibodies against HCV in serum, saliva, lymphocytes or other monounclear cells. The antibodies may be used in the prevention of HCV infection.
                                                                             DNA and amino acid sequence of HCV envelope 1 and core proteins - used to determine HCV genotype and as vaccines against HCV infection \,
                                                                                                                                                                                                                                                                     Gaps

The sequences AAR96526-R9657B represent novel sequences isolated from hepatitis C virus subtypes different from subtypes 1a-c, 2a-d, 3a-f, 4a-j, 5a and 6a. They esp. from the novel subtypes 1a-c, 2a-d, 3a-f, 3d-d, 5a and 6a. They esp. from the novel subtypes 1d-f, 2a-l, 2k, 2l, 3g, 4k-m, 7a-c or types 9, 10 or 1l. The sequences corresp. to the 5' genome. This sequence represents amino acids 1-317 from the HCV types 7c and 8a isolates VM; the Core/El, NS4 or NS5B regions of the Stance of the control of the contr

CDNA was prepared from HCV genomic RNA. Full-length clone JK1-B (9405 nucleotides long) and 14 shorter clones were isolated by PCR amplification, including clone JK3-B. Primer/probes derived from the sequences of these clones can be used in diagnostic assays for HCV. See AAQ40425-040439.
                                                 cDNA was prepared from HCV genomic RNA. Full-length clone JK1-B (9405 nucleotides long) and 14 shorter clones were isolated by PCR amplification, including clone JK3-A. Primer/probes derived from the sequences of these clones can be used in diagnostic assays for HCV. See AAQ40425-Q40439.

                                                                                                                                                                                                                                                                                                                                                                                                       AAR92936-R92987 are HCV core proteins derived from 52 different HCV isolates. Isolated cDNA sequences are used for the prodn of primers useful for detecting the presence of HCV in a sample, the primers are also useful for HCV genotyping. Proteins encoded by the cDNAs can be used in vaccines for immunising against HCV infection. The proteins may also be used to detect antibodies against HCV in serum, saliva, lymphocytes or other monounclear cells. The antibodies may be used in the prevention of HCV infection.

The invention relates to a mosaic protein, comprising a plurality of homologous antigenic peptides from different genotypes of a species. The antigenic peptides are from nucleocapsid (NC) proteins. A method for synthesising an artificial gene that encodes the mosaic protein is also provided. The method is designated restriction endonuclease assisted ligation (REAL). The mosaic protein and the artificial mosaic protein and the artificial mosaic protein is also useful for detecting a hepatitis infection in an individual. The mosaic gene and protein is also useful for vaccination against infection, especially hepatitis C. The method of synthesizing the infection, especially hepatitis C. The method of synthesizing the spectrum of immunoreactivity, and antigen specificity of enzyme immunoassays. This provides improved detection of hepatitis C virus. Sequences AAV06673-683 represent amino acid sequence of each monomer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Polymerase chain reaction; PCR; amplify; primer; non-A, non-B hepatitis; NANBH; virus; blood transmissible; detection; hepatitis virus; RT-PCR; C100 antibody; HCV RNA; NSS region.

                                                                                                                                                                                                                                                                                                                                                                                                                                 cDNA was prepared from HCV genomic RNA. Full-length clone JK1-B (9405 nucleotides long) and 14 shorter clones were isolated by PCR amplification, including clone JK3-C. Primer/probes derived from the sequences of these clones can be used in diagnostic assays for HCV.

expression cassette including a first polynucleotide region including a 5' non-coding region (NRI) sequence of an RNA virus and at least an N-terminal portion of a coding sequence of RNA virus, a second polynucleotide region including a 3' untranslated region (UTR) sequence of the RNA virus and at least a C-terminal portion of a coding sequence of the RNA virus and a third polynucleotide region encoding a reporter cof the virus and a third polynucleotide region encoding a reporter molecule, flanked by first and second polynucleotide regions; and a promoter sequence being operatively linked to expression cassette in a moner so as to enable a transcription of a minus strand RNA molecule from the expression cassette. William the expression cassette uncletc acid construct of the invention is useful for detecting the presence of an RNA virus in a cell. It is also useful for screening anti-viral drugs and determining drug resistance of an RNA virus. The present sequence is Hepatitis C virus (HCV) isolate HCV-SI full-length polyprotein.
non-B hepatitis (NANBH) virus. The cDNA sequence was isolated using the primers given in AAQ63500-35. The amplified fragments are used in the detection of hepatitis virus. The target DNA was isolated from serum of chronically infected NANBH patients who were C100 antibody-positive and HCV RNA (NS5 region) positive. Reverse transcription-PCR and PCR were performed on CDNA and the total human NANBH DNA was constructed from 23 clones.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      and a promoter operably linked RNA transcription of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is that of an antigen used in a novel assay for determining anti-HCV antibody titre. A sample is diluted to an absorbance of not more than 2.0 and the peptide antigen is added. The method is useful for monitoring the effect of interferon treatment on anti-HCV antibody titres.

Virology 188:331-341(1992)

-i- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE
HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.
NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
-i- SUBUNIT THE VIRION OF THIS VIRUS IS A NUCLEOCARSID COVERED BY LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAFSID IS A COMPLEX OF PROTEIN C. AND MRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           MEDIINE-92230232; PubMed-1314459; Okamoto K., Lizuka H., Okada S.I., Yamamoto K., Lizuka H., Tanaka T., Fukuda S., Tsuda F., Mishiro S.; "Full-length sequence of a heptitis C virus genome having poor homology to reported isolates: comparative study of four distinct

T Complex of NS3 protease and NS4A peptide of BK strain hepatitis C
Y virus: a 2.2-A resolution structure in a hexagonal crystal form.";
Protein Sci. 7:837-647(1998).

-1- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE
HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELACED FUNCTION.
NS3 AND NS5 AMAY PLAY A ROLE IN THE VIRAL FNA REPLICATION.
C-1- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral
precursor polyprotein, commonly with Asp or Glu in the P6
position, Cys or Thr in P1 and Ser or Ala in P1'.
C-1- CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate +
                                                                                                                                                                                                                                                                                                                           the viral

Genome polyprotein [Contains: Capsid protein C (Core protein) (P22);
Envelope glycoprotein El (GP32) (GP35); Envelope glycoprotein E2
(GP68) (GP70) (NS1); Protein P7; Nonstructural protein NS2 (P21)
(EC 3.4.22.-); Protease/helicase NS3. (P70) (Hepacivirin)
(EC 3.4.21.98); Nonstructural protein NS5A (P56); Nonstructural protein NS5B (P66) (P70) (RNA-directed RNA polymerase) (EC 2.7.7.48)].
NS5B (P66) (P70) (RNA-directed RNA polymerase) (EC 2.7.7.48)].
Hepatitis C virus (isolate Japanese) (HCV).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         -1- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.
NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
-1- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 position, Cys or Thr in P1 and Ser or Ala in P1'.
-1- CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: PROPEIN M AND GIYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
